

**Problem 5:** Isochoric heat capacity  $C_V$  of Argon

Derive an expression describing the volume dependence of  $C_V$  for a gas assuming the pressure approximation  $PV/(nRT) = 1 + B_2(T)n/V$ , where  $B_2(T)$  is the 2nd virial approximation. Calculate the approximate change of the molar isochoric heat capacity of Argon during an isothermal expansion starting at 10 bar and ending at 1 bar at 323 K. Use the following values for  $B_2$ :  $-15.49 \text{ cm}^3 \text{ mol}^{-1}$  at 298 K,  $-11.06 \text{ cm}^3 \text{ mol}^{-1}$  at 323 K,  $-7.14 \text{ cm}^3 \text{ mol}^{-1}$  at 348 K. Hint: Neglect terms containing products of  $B_2$ .

**Problem 6:** State functions  $F$  and  $G$

Show that the free energy,  $F = F(T, V)$ , and the free enthalpy,  $G = G(T, P)$  are state functions.

**Problem 7:** Thermodynamic relations

Show:

$$(i) \quad \left(\frac{\partial H}{\partial P}\right)_T = -T \left(\frac{\partial V}{\partial T}\right)_P + V$$

$$(ii) \quad \left(\frac{\partial G}{\partial V}\right)_T = V \left(\frac{\partial P}{\partial V}\right)_T$$

$$(iii) \quad \left(\frac{\partial H}{\partial G}\right)_T = \frac{1}{V} \left[-T \left(\frac{\partial V}{\partial T}\right)_P + V\right]$$

$$(iv) \quad \left(\frac{\partial P}{\partial T}\right)_G = \frac{S}{V}$$

**Problem 8:** Inversion temperature of Argon

In class we had discussed the Joule-Thomson coefficient  $\mu_{JT}$ . We concluded that  $\mu_{JT} < 0$  implies heating and  $\mu_{JT} > 0$  means cooling of the gas.  $\mu_{JT} = 0$

defines the inversion temperature  $T_{inv}$ . Determine  $T_{inv}$  for Argon using the approximate pressure  $P \approx P_{ideal}(1 + B_2(T)n/V)$  and the following values for the 2nd virial coefficient  $B_2(T)$  of Argon: (T/K,  $B_2/\text{cm}^3 \text{ mol}^{-1}$ ), (300, -15.5), (400, -1.0), (500, 7.0), (600, 12.0), (700, 15.0), (800, 17.7), (900, 20.0), (1000, 22.0).
